BM-02 Baby breathing monitor

BM-02 NANNY is a baby breath monitor that keeps an eye on the baby when its parents sleep. NANNY continuously checks the baby´s breathing and movements to give an early warning during possible danger.

Beschreibung

NANNY triggers a loud acoustic and visual alarm if the baby's breathing and movements stop for longer than 20 seconds or if the rate of breathing is bellow 8 breathes per minute. This allows for SIDS (Sudden Infant Death Syndrome/Crib death) and other life threatening conditions (allergy, sudden illness, choking...) to be indicated in time to help save the baby.
