

Back-up Voltage Module ZZ-12

It can be used as a backup power supplier of 12VDC/max.500mA. This module has to be connected to a rechargeable battery such as model SA-214/1.3. It must be powered by 15VAC on the input terminals. A suitable transformer or a DE-20-15 adapter can be used for this purpose. There are two LEDs on the module: one as an indicator of AC input voltage and the second one as indicator of 12VDC output. The module recharges the battery automatically.
